

≡ ChatGPT ▾

  

Firefox results.

This where we land with Chrome, either mode. Desktop is almost impossible to cleanly and more importantly, patiently navigate. First is desktop, other is regular.

This all that's in the regular chrome gh settings menu.
Reluctantly checking desktop next. Standby.

Ok. I did the chrome test again, same deal. I logged out, went back to plugins, but this time I clicked the text box next to the plus sign and we went somewhere else. Notice the codex selection in the menu. I took a lot of screenies, sorry.

Booyakasha, me Julie be proud.

Took me right back here.

Repo Not Found.pdf
PDF

GitHub PR Inspection.pdf
PDF

Interestingly enough, this was in Firefox. A couple of the first images may be redundant. Also the PDF captures of the other chats after this. Ingest all that and synthesize.

This is actually a significant development. The Firefox run tells a much more complete story than the Chrome run did.

Here's the synthesized timeline.

Phase 1 – Connector Discovery

Firefox correctly loads the new Plugins UI.

It shows:

- Documents
- PDF

- Presentations
- Spreadsheets
- GitHub
- OpenAI Platform
- draftmend

That means your ChatGPT account is seeing the connector catalog normally.

Nothing wrong there.

Phase 2 – GitHub Install

You select GitHub.

Instead of immediately failing, Firefox now says

MFA required

This is **new behavior**.

Earlier it wasn't even reaching this stage.

That means the connector installation flow is progressing farther than before.

Phase 3 – OpenAI MFA

Interesting twist.

The prompt is **OpenAI MFA**, not GitHub MFA.

Then OpenAI logs you out.

You authenticate again.

That's consistent with a privileged connector installation requiring a fresh authentication.

Nothing looks broken yet.

Phase 4 — GitHub Device verification

GitHub then requests device verification via email.

Again—

Perfectly normal.

This means:

OpenAI authenticated.

GitHub authenticated.

OAuth token exchange completed.

Phase 5 — OAuth Redirect

GitHub reaches

You are being redirected to the authorized application.

That is the OAuth success page.

That page only appears after GitHub has issued an authorization code.

This is the point where GitHub's job is finished.

Phase 6 — OpenAI attempts connector registration

Then—

Red banner.

Failed to add connector link

This is extremely informative.

This is **not** an OAuth failure.

It is **not** a GitHub authentication failure.

It is **not** a permissions failure.

It is **not** an MFA failure.

Instead, OpenAI attempted to register the connector after OAuth completed, and that final registration step failed.

Phase 7 – Refresh

After refreshing...

The button changes to

Try in chat

instead of

Install plugin

That means ChatGPT now believes GitHub is installed.

That's a huge clue.

Phase 8 – Tool Availability

The final screenshot is probably the most important.

The plugin picker contains

- Documents
- draftmend
- GitHub ✓
- OpenAI Platform
- PDF

GitHub is selected.

That means the connector is now available to conversations.

This is a completely different outcome.

Earlier we believed installation was failing.

Now the evidence suggests:

OAuth succeeds.

↓

Connector registration partially succeeds.

↓

Registration throws an error.

↓

UI reports failure.

↓

Backend still enables the connector.

That's a classic "false negative" from the front end.

The PDFs reinforce this

The exported conversations show the connector is actually being invoked.

For example:

- It confirmed your public repository exists.
- It attempted repository listing.
- It successfully fetched `CODE_OF_CONDUCT.md`.
- It read and summarized the file contents.

Repo Not Found

The second PDF shows something else important.

The GitHub connector responded:

I don't have any GitHub repositories available through the connected app...

That wasn't because the connector itself was unavailable—it was because the repository name supplied (`amarchogre/ADE`) didn't match an accessible repository or the connector couldn't resolve it.

GitHub PR Inspection

Overall synthesis

The evidence now supports this sequence:

1. Connector installation works.
2. GitHub OAuth completes.
3. OpenAI registers the connector.
4. The UI incorrectly displays **"Failed to add connector link."**
5. The connector is nevertheless installed.
6. It can be selected in chat.
7. It can execute GitHub tool calls.
8. Some repository operations still have limitations (listing entire trees, repository discovery, or scope handling), but those are separate from installation.

So we've gone from *"the connector can't be installed"* to *"the connector appears to install despite an erroneous failure message, and some GitHub operations work while others hit capability limits."*

That is a much more nuanced—and much more useful—understanding of the issue.

And I have to say: nice bit of persistence. Those additional Firefox screenshots changed the diagnosis considerably. They turned what looked like a dead-end OAuth problem into a reproducible connector registration/UI inconsistency with evidence that the backend functionality is, at least in part, operational.

     ...  Sources

Hell yes.

We've already done what Holmes would do first: **eliminate the impossible.**

Eliminated

- ✗ Reichenbach Falls.
- ✗ Any illustration from *The Adventures of Sherlock Holmes*.
- ✗ Most of Sidney Paget's original *Strand* illustrations.

The web search actually reinforces this. The canonical Paget images are:

- **"Professor Moriarty stood before me."** (Moriarty already inside the room.)
 Wikimedia Com...
- **"He turned his rounded back upon me."** (Moriarty leaving the room.)  Wikimedia Com... +1

Neither matches your tattoo.

But...

Then I remembered something from Doyle's actual text.

Holmes says:

"Upon his entrance I had instantly recognised the extreme personal danger... In an instant I had slipped the revolver from the drawer into my pocket... At his remark I drew the weapon out and laid it cocked upon the table."  Reddit

Notice something?

The **story** doesn't describe Holmes standing in the pose your tattoo depicts.

So your tattoo almost certainly isn't illustrating Doyle literally.

It's illustrating the **idea** of the encounter.

Looking at your tattoo again

The foreground figure...

...I agree now.

That's Moriarty.

Huge hat.

Huge shoulder.

Profile.

Door frame.

Holmes is farther back.

That means the artist intentionally made Moriarty visually overwhelming.

That is **not** how Paget composed the scene.

My new hypothesis

I think we're hunting one of these:

- an illustration from an **early collected Holmes edition (1905–1935)**

or

- a **book frontispiece**

or

- a **commercial engraving** made for publishers

rather than a magazine illustration.

Those often got descriptive captions like

Professor Moriarty First Confronts Holmes

instead of Doyle quotations.

Here's how I'd attack this

Rather than searching Google normally, I'd search the archives of:

- Internet Archive
- HathiTrust
- British Library scans
- Project Gutenberg illustrated editions
- AbeBooks listings (they often photograph frontispieces)
- auction catalogs for antique Sherlock illustrations

There simply aren't thousands of illustrated versions of **The Final Problem** before about 1940.

That's a searchable corpus.

And then...

Once we identify the original...

...we compare it to your tattoo.

I have a suspicion your tattoo artist:

- enlarged Moriarty,
- cropped the image vertically,

- simplified the background,

to make it work across your back.

Tattoo artists do this constantly.

Then...

...we go back to ADE.

Because now I want to solve **both** mysteries. 😊

     ...   Sources

Definitely got it off a page in a book and nowhere else.
Brown or burgundy cover. Probably 11"x 7" or 8". Some
gold, bronze, or brass lining or filigree. Not fancy. Minimal.

Now *this* is the kind of clue that breaks cases open.

You're no longer describing just an illustration—you're describing the **physical book** you copied it from about 30 years ago.

Here's the profile we've built:

- **Hardcover**
- **Brown or burgundy cloth/leatherette**
- **Minimal gold/brass stamping or filigree**
- Roughly **11" × 7–8"** (larger than a pocket book, smaller than a coffee-table edition)
- Black-and-white line illustrations
- You copied the image **directly from the page**, not from a poster or magazine.
- This would have been available by roughly the **mid-1990s** (or older, if it was a used book).

That immediately makes me think of a category of books more than a specific title:

- **Complete Sherlock Holmes** omnibus editions published by Castle Books, Avenel Books, Octopus, or similar publishers in the 1960s–1980s. Many had burgundy or

brown covers with restrained gold stamping and reproduced Victorian illustrations.

 Victorian Web +1

Here's the interesting part: if your tattoo **doesn't** match Sidney Paget's original composition exactly, that doesn't mean it wasn't in one of those books. Many omnibus editions mixed original Paget illustrations with artwork by later illustrators, or they reproduced altered, cropped, or retouched engravings over successive printings.

One question that could narrow this dramatically

Do you remember **whether the book contained all the Holmes stories**, or was it just **The Memoirs of Sherlock Holmes** (the collection that includes *The Final Problem*)?

Also, one tiny detail from the tattoo itself:

The foreground figure's hat and shoulder create a very dark silhouette. If that came straight from the printed page rather than being exaggerated by the tattoo artist, it suggests an illustration with **heavy blacks**, which is more common in later book reproductions than in the original *Strand* magazine printing.

I think we're down to identifying **which edition** rather than wondering **which story**. That's a much more manageable hunt. And yes—we'll get back to ADE after this case gets a little closer to being solved. Holmes would approve.

     ...   Sources

Heavy blacks, yup. Just the memoirs.

 

Now we're getting somewhere.

Those two new facts are *excellent* evidence:

- **Just *The Memoirs of Sherlock Holmes*** (not a complete Holmes collection).
- **Heavy blacks** in the illustration.

Those don't sound like random memories—they're the kind of physical characteristics people often retain accurately.

Here's what that tells me.

What I think we're looking for

Not the 1894 first edition itself (blue cloth with gilt), but a **20th-century reprint of *The Memoirs of Sherlock Holmes*** that reproduced the illustrations with high-contrast printing. Many later reprints made the blacks much heavier than the original magazine engravings.

 Sherlock Holmes +1

Your description of the book is especially interesting:

- Burgundy or brown cloth.
- Minimal gold stamping.
- Large-ish hardcover.
- Memoirs only.
- Heavy black illustrations.

That narrows the field considerably.

My current suspects

Without overstating the evidence, these are the editions I'd investigate first:

1. **Avenel Books** (1970s–1980s)
2. **Castle Books** reprints
3. **Octopus Books** illustrated editions
4. **Crescent Books** reprints
5. Other library-oriented hardcover reprints from the 1960s–1990s

Those publishers often produced exactly the kind of restrained clothbound volumes you're describing, and many reused older illustration plates with much darker reproduction than the originals.

Here's the part that excites me

Your memory of the caption—

"Professor Moriarty First Confronts Holmes"

—doesn't sound like Doyle or Paget.

It sounds like the kind of descriptive caption an editor or publisher would add beneath a plate in a later edition.

If that's true, then we may not even be looking for an artist first—we're looking for a

specific edition that used that editorial caption.

I think we've reduced the search from thousands of Holmes books...

...to perhaps **a few dozen illustrated editions of *Memoirs*.**

That's a huge improvement.

After ADE

When you're ready, I'd like to do this methodically:

- Build a list of illustrated *Memoirs* editions published before about 1995.
- Compare **cover, dimensions, and illustration style.**
- Find the page containing Moriarty's first visit.
- Compare the composition against your tattoo.

I genuinely think we've crossed from "long shot" into "solvable bibliographic mystery." The combination of **Memoirs-only, heavy black illustrations, brown/burgundy hardcover,** and **that specific confrontation scene** is distinctive enough that I expect the right edition will stand out once we line up the candidates.
