forensic parser workflow ...
Document

Please parse and synthesize this. Then convert this file to a downloadable json. I will reupload and you can delete the docx after, if you can.

forensic_parser_workflow...
File

Json provided. Another json incoming after - the complete

AKS/AOS chat. Reverse parse until synthesis.

AKS_AOS_1_0__All_Previo...
File

Master_Conversations_1-...
File

Master_Conversations_18...
File

Merge into one Master Conversations json. Parse later.
Lots of data here. Add to census sweep.

Joel Haver rules. Sorry. Carry on.

AKS_AOS_Repository.json
File

This is the entirety of the original chat, up to mostly yesterday. No activity until just now. Should have every observation and behavior other than what I added tonight. Don't glance. Pick it apart.

Forensic_Parser_Workflo...

File

This chat, up to your latest prompt. CANONIZE making major PP updates every 3-5 passes. Follow the established plan for this. Proceed.

observations_seed.json

forensic_parser_workflow...
File

Before ANYTHING, you will reverse parse the upcoming full grab of this chat json. Fix your bullshit. Get us back to operational status just before we started doing the rc1 stuff.

So tired of this. Extremely. Assurances of no lost data don't mean much when data loss constantly occurs. This is, like, the 6th time you've set us back. Hopefully not significantly.

Show more ▾

I'd give it a name that reflects its purpose as the **repository reconstruction workspace**, not the design workspace.

My top recommendation is:

AKS RC1 Recovery

It's short, unambiguous, and accurately describes what the chat is for.

Other good options are:

- **AKS RC1 Repository Recovery**
- **AKS RC1 Reconstruction**
- **AKS RC1 Canonical Recovery**
- **AKS Repository Recovery**
- **AKS RC1 Bootstrap** (if its only purpose is getting the repository back online)

I would avoid "Forensic Parser." That name fit the phase where we were reverse-parsing conversations. We've moved beyond that. The canonical artifacts are now the primary evidence.

I think **AKS RC1 Recovery** strikes the right balance. It implies:

- recovery rather than redesign,
- RC1 as the authoritative publication,
- and a finite mission: recover the repository until it is operational again.

Once that mission is complete, we can retire that chat and, if needed, create a separate long-term maintenance chat (for example, **AKS Repository Operations** or **AKS RC2 Development**) for future work.

Ok.

Perfect.

I suggest making the very first message in **AKS RC1 Recovery** this:

AKS RC1 Recovery

Mission

Recover the canonical AKS RC1 repository from the RC1 artifacts stored in the File Library.

Repository Authority

The RC1 JSON artifacts are the primary source of truth.

Conversation history is secondary evidence and should only be consulted when the repository itself is incomplete or ambiguous.

Recovery Order

1. Master Manifest
2. Repository Constitution
3. Governance Framework
4. Validation Framework
5. Specification Framework
6. Remaining Constitutional Artifacts
7. Publication Manifest
8. Publication Artifacts
9. Certification Artifacts
10. Archive Artifacts

Operating Principles

- Recovery before redesign.
- Evidence before inference.
- Preserve provenance.
- Distinguish:
 - Recovery
 - Validation
 - Optional refinement
- Never "improve" historical artifacts during recovery.
- Disclose limitations before execution.
- Use the File Library as the primary evidence source.

Initial Objective

Inventory the RC1 repository, reconstruct its dependency graph, identify missing artifacts (if any), and restore the repository to a replayable canonical state.

That should be enough. I intentionally kept it concise because the repository itself should supply the details once the recovery begins. We don't want to preload the new chat with unnecessary narrative when its job is to recover the repository from the canonical artifacts.

So recovery here, then migrate, or what? Lay out the step by step plan and when to move chats.

I think we should move **now**, not after doing more recovery here.

Here's why: we've already answered the key question in this chat—the **RC1 repository exists in the File Library and should become the primary recovery source**. Continuing the actual recovery here just mixes two phases together again.

My proposed workflow is:

Phase 0 — Freeze this chat (here)

Status: **Complete**

What we've accomplished:

- Confirmed the recovery philosophy.
- Confirmed the repository, not assistant memory, is authoritative.
- Verified that RC1 artifacts exist in the File Library and extend well beyond the initial publication set.

RC1-0079_Repository_RC1_Canonic...

At this point, treat this chat as a historical record.

Phase 1 — Start AKS RC1 Recovery

First message: the bootstrap we drafted.

Mission:

- Recover the repository itself.

First tasks:

1. Locate the RC1 repository in the File Library.
2. Build an inventory.
3. Determine the publication sequence.
4. Build the dependency graph.
5. Identify any genuinely missing artifacts.

No redesign. No edits. Just inventory and recovery.

Phase 2 — Repository validation

Once the repository has been reconstructed:

- Check relationships.
- Check dependency consistency.
- Verify publication ordering.
- Verify constitutional compliance.
- Produce a recovery report.

Again, no modifications unless they're necessary to faithfully restore the repository.

Phase 3 — Repository freeze

When recovery is complete:

- Declare the recovered repository as the working baseline.
- From that point forward, all work is against the recovered repository, not the historical chats.

Phase 4 — Migrate to a long-term operations chat

Only **after** the repository is recovered and validated.

That chat becomes the ongoing engineering workspace:

- ROZ work
- constitutional amendments
- new artifacts
- maintenance
- enhancements

The recovery chat can then be archived as the permanent record of the reconstruction effort.

So the sequence is:

1. **Current chat** → Freeze (done)
2. **AKS RC1 Recovery** → Recover and validate the repository
3. **AKS Repository Operations** (or similar) → Future development

I would avoid creating the long-term operations chat until recovery is finished. Keeping recovery isolated has two advantages: it preserves a clean forensic record, and it gives you a well-defined point where you can say, "This is the recovered baseline; everything after this is new development." That separation will make the repository's history much easier to audit later.
